What would you like to do with the imported Skillcast project?
Get it running on Replit
Worked for 22 seconds
Checkpoint made 20 minutes ago
I'll check how the frontend connects to the backend, install the needed dependencies, and configure a run workflow. I'll keep the existing structure and flag any features that need an external service.
6 actions
The frontend currently uses its own built-in demo data and doesn't call the Python API. I can serve both from one address without changing that behavior. I'll also fix the Run command, which currently points to a missing file. No API key is needed to open the existing dashboard.
24 actions
Skillcast is now running in Preview. The dashboard renders, all four API endpoints return data, and the server blocks access to private files.
The existing demo behavior is unchanged: the dashboard still uses its built-in catalogue, while the Python API is available separately. I've documented how to run it in replit.md.
